

Trans@ction eXpress enables companies to leverage IBM CM8 with FileNet BPM as part of a comprehensive business process management solution.

Trans@ction eXpress & Content Manager

Trans@ction eXpress, TriTek Solutions' customizable business process management framework, is now fully compatible with IBM Content Manager (CM8). Previously, Trans@ction eXpress was exclusive to the heritage FileNet Content and Process Engines. Based on the tremendous demand from IBM CM8 clients, however, TriTek customized Trans@ction eXpress to leverage CM8 as the integrated content store. Now, clients can leverage the best of breed IBM FileNet Business Process Management process engine with either the IBM FileNet Content Manager or IBM CM8 (or both) as the content repository.

Trans@ction eXpress now enables organizations to extend their IBM CM8 environments and leverage IBM FileNet's Business Process Manager (BPM) framework for the deployment of more holistic content and process management solutions. In this environment, Trans@ction eXpress accesses content directly from IBM CM8 repositories, accesses workflows managed through IBM FileNet BPM, and uniformly presents the content and work item detail to the user in the intuitive Trans@ction eXpress interface.

Through Trans@ction eXpress, organizations can not only deploy more comprehensive user-based solutions, but they can also take advantage of the complete set of tools and features available through BPM. This includes: Process Analyzer, Simulator, Business Activity Monitor, as well as the robust Component Integrator capabilities enabling the integration of external systems directly within a business process.

Alternative to IBM FileNet Content Federation Services

Trans@ction eXpress provides a faster, more transparent alternative to IBM FileNet Content Federation Services (CFS). For applications that require access to a single repository, Trans@ction eXpress communicates directly with IBM CM8 without any additional layers to increase the time of each transaction. Rather than search through a series of repositories, Trans@ction eXpress is connected directly to the relevant content store for each particular application, minimizing critical response time. Further, because installation, configuration and maintenance of a CFS server are avoided, Trans@ction eXpress provides a solution with reduced cost and complexity.

Who should use Trans@ction eXpress IBM Content Manager Edition?

Implementation of Trans@ction eXpress in conjunction with IBM Content Manager is ideal for customers who want to leverage their existing investment in IBM CM8 while enhancing applications to include business process management capabilities. The addition of a customized BPM solution to content management will enable businesses to create a more efficient workflow environment while incorporating company standards and industry best practices.
